# Summary of Router Lab

To preface, we were told to skip step 3 at the time when Jeffrey and Wiltiana were setting up their Local IPs, also the firmware update step completely stopped our progress as we were not able to access the admin interface after the firmware update.

(**Step 1)** Setting up the physical connections with the ethernet cables and the laptop, antennas and resetting the router to make sure it's starting afresh. **(Step 2)** To access the admin interface, we typed the default gateway IP: '192.168.1.1, entered the default credentials and it prompted us to create a new password, which we did. Next for (**Part 2.1)**, with the router having the default IP address of 192.168.1.1, we changed it to 192.168.50.1 which we were able to access after typing it into a new tab. This change is done by going into the LAN settings of the asus router page and changing the LAN IP.

(**Part 2.2)** DNS (Domain Name System) come default from your router by your ISP (Internet Service Provider). However, it is better to use Google's DNS for faster browsing and better security. We will go into DNS in our WAN settings to configure our Google DNS. For (**2.3)**, we manually assigned our laptop's IP address under the DHCP reservation so it is the same everytime it connects to the network. For (**2.4)**, we blocked my teammate's laptop from our Wifi network using his laptop's  MAC address which we found using 'ipconfig /all'. Let's say he was connected, once we add his device to be rejected, he'll lose internet access immediately. (**2.5)** led us to enable port forwarding for a specific local port (80). For example, this'll allow one to host game servers for people outside the network to join.

Even though we weren't able to do **Part 3**, one has to connect their laptop to the ASUS router, then to the Linksys router. To find the IP address of the Wireless Access point, one would have to use ASUS device discovery. **(4.1)** We changed our default admin credentials to something more complex for security reasons, then we ran into an issue with updating the firmware. After the update for the firmware was complete, we weren't able to access the admin interface after multiple attempts and resets.
